Sequence Analysis of 22 2D Gel Bands.
8/11/99

Band C58. The peptides shown in Table 1 were detected in Band C58 (LB6-43-1). These peptides belong to Novel #1.

Table 1. Peptide sequences from Band C58 (LB6-43-1).

Peptide No.	Measured M W ($M+H^+$, Da)		Peptide sequence by CAD[1]
1	≈1482.8	+2	ATSC[a]GLEEPVSYR
2	1499.4	+2	ATSC[a](o)GLEEPVSYR
3	5033.8	+5	- - - XSDSMEC[a] - - -
4	5049.7	+5	- - - XSDSM(o)EC[a] - - -

GLEEPVSYR ~ 9mer

[1]I and L cannot be distinguished by low energy CAD but are inferred by the database sequence, M(o) designates oxidized M, C is carbamidomethyl modified unless noted as C[a] (acrylamide), _ designates a single unknown residue, - - - designates an unknown number of unknown residues.

Name: Jagathpala Sheth Date: 9/7/19. Genetic CDNA

Experiment: Cloning of C58 (Screening of Library) 050

A culture of K 802 strain host ~~C58~~ was made.

medium used : NZCYM medium:

2 ml of NZCYM + 20 µl of 20% maltose soln (Actual conc is 0.2% in the medium)

K 802 Cells host strain taken from -70°C with a sterile tip taken out and placed inside the medium.

Kept at 37°C - Shaker.

Name: Jagathpala Sheth Date: 09/08/99.

Experiment: Cloning of C58

051

Titration of the λ DR2 Library.

(λ DR2 - Human Testis cDNA Library)

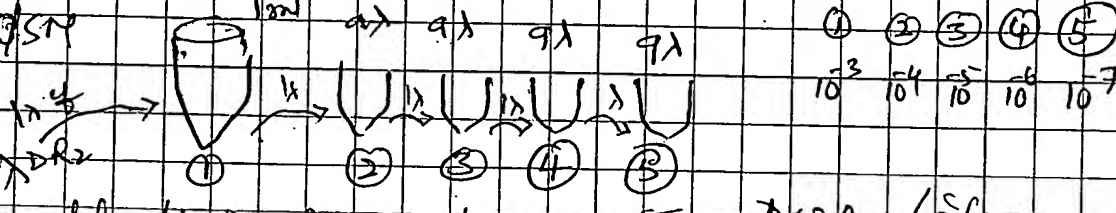
① One NZCYM medium was thawed using microwave.

② About 20 ml each of the medium was plated on 5 plates and the cap was kept open (in the Sterile Hood)

③ Mean time Take the culture of K802 left at 37°C previous day.

~~and Take~~

④ Take 1ml of SM buffer (buffer for λ DR2 i.e. phage buffer) in a tube. and 9µl each to 4 other tubes.



add 1λ of λDR2 human T cDNA Library to the first tube. Vortex.

Take 1λ from tube 1 to tube 2, vortex and take 1λ from #2 & transfer to 3 and so on. Vortex.

Take 1λ each from each tube and to a 10 ml tube (round bottom).

Important

Laboratory Research

National® Brand

Name: Jagathpala Shetty Date: 09/08/99

Experiment:

(5) Add 75λ each of the K802 culture to all tubes. - Wait for 20 minutes.

(6) Keep three Raw N2 Cyne - agarose (0.7%?) medium and allow it to come to ≈ 50°C (for the top layer)

(7) Keep a water bath at 37°C with a thermometer.

(8) Keep the tubes at 37°C for 2 minutes

(9) Take ≈ 4 ml of the melted ~~agar~~ N2 Cyne agarose - in to the tubes containing 1 ml of the Contents from the tubes to the LB Agar plates, Swirl the plates as you pour. Allow it to cool for 10 min. to allow the inoculum to soak in to agar.

(10) Incubate plates at 37°C O/N.

Name: Jegathgaler Sneh Date: 09/09/19

Experiment: Screening of Library

056

DNA labelling

Protocol: Feinberg & Vogelstein Method

TO a sterile microfuge add:

C-58-EST	DNA	(≈50ng)	ie: 2µl
	H_2O		31.5
	Boil → 5min		
oligolabeling buffer	OLB		10λ
	[α^{32}P] dCTP		5λ
	Klenow		1.5λ

* After adding OLB keep at −20 for a while.

Add 5λ of α^{32}P dCTP and 1.5λ of Klenow. Tackle for a while and leave at 37°C.

Name: Jagathpala Sethi Date: 09/10/99.

Experiment: Cloning of CSB- Contd. (Library Screening) 057

The plates - taken out from 37°C and chilled at 4°C.

Membrane lifting.

① The nylon membranes - 6 of them membrane and 3 marks - were done at 3 corners - randomly.

② Membrane - placed on the plate carefully in one attempt. (Do not lift and change the position) - Leave for 2 min. (using tweezers)

③ Lift - make 5 marks with syringe needle. also make mark on the side of the plate corresponding to pencil mark on filter. Take the membrane carefully from one end and by using tweezer and place it on a whatman filter paper soaked with denaturation soln - 5-10 min. Film should be placed phage side up. Change positions in order ensure the complete immersion of the filter in the solution.

④ Place the membrane on a whatman paper containing Neutralization buffer. Change positions - ensure complete immersed and - 5-10 minutes

⑤ Cross-linking:

① Place inside on a whatman

② press power on

EXHIBIT 12

(2) Let anto cross link

(3) Start - 9x roll & Start at 1200 come down to zero.

(4) Dry the blots.

(5) The plates are wrapped in saran wrap and placed at 4°C.

(6) The filters are ~~kept~~ placed in a tray ~~for~~ of H_2O containing ~~2x SSC~~ 2x SSC & 0.2% SDS to remove any protein & debris at 42°C. (≈ 15-30 min.)
(This step not crucial)

(7)

Prehybridization

Soln: Total of 40 ml

20 ml	Formamide
8 ml	SSC 25x
4 ml	Denhardts - (stored at 4°C)
2 ml	$NaPO_4$
4.2 ml	H_2O
2 ml	yeast RNA
0.8 ml	~~2.5%~~ 25% SDS - (add last)

Filter the solution using a 50 ml syringe to a 50 ml tube.

Name: Jagathpala Shah Date: 09/10/99

Experiment: C58 – cloning – contd (Screening of Lebrary)

059

* Open a food bag at one end.
* Take the fetter out using a folded what man and put it to the bottom of the bag.
* Seal ~~the~~ one side of the bag. – 2 seals.
* Pour about 20 ml of the prehyb. solution from front
* Push the air bubbles out carefully. Save 20 ml for hybridization
* Seal the top – 2 seals.
* ~~Pour about 20 ml of the prehybe Sol~~.
* Keep at 42°C – 3 hrs.

~~Purification of~~

Important:

EXHIBIT 14

National® Brand Laboratory Research

Purification of the probe (DNA)

DNA purifying column - ~~cut at the tip~~
Remove the bottom cover. Cut the tip off just below the matrix. Remove the plug off. ~~for~~ Take out the plunger. insert into a 5 ml Syringe.

* ~~Load~~ equilibration of the column :- 5 ml of Elutip-(low salt soln) = ~~Slowly~~ Put the plunger and slowly elute out the equilibration buffer. to a 15 ml tube.
* Take the labelled DNA (crude). Take ≈ 900 ml of Elutip (low salt) :- ~~Elute out the equilibration buffer.~~ Add one more ml of Elutip.
* Put the plunger and slowly press the plunger and get the ~~un~~labelled DNA to a 15 ml tube.
Add ≈ 4 ml of the Elutip to the Syringe (Each time you reload the buffer disconnect the syringe, take the plunger out & then load sample)
* Disconnect the column. Connect to a 2 ml. fresh syringe (take the plunger out before connecting). Load ≈ ½ ml of High salt solution.

EXHIBIT 15

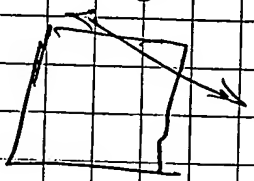
Name: Jeyathpala Sneh Date: 09/10/99

Experiment: C58. Cloning - contd.

Replace the plunger and collect the labelled DNA to a 1ml microfuge tube.

Hybridization.

* Take out the membrane in the bag place a cut across the corner.



* Pour off the soln to sink.
* Take the prefixed probe and boil it for 5 min. (Open the tube in between (after ~40sec) and release press.)
* Take 20ml of the hybridization buffer (saved from earlier prehybridization step) and add the labelled DNA to it.
* Pour this into the bag containing membrane
* Carefully remove the air bubbles out.
* Seal safely - 2
* Get the remaining bubbles to the corner and seal again.
* clean all the area.

Name: Jagathpala Sneha Date: 09/11/99

Experiment: C58- cloning- contd

062

Washing of the membranes:

* Take out the bag, cut the corner - drain it to dead container
* Take out the membranes after cutting 3 sides
* ~~Place the membrane inside~~ Pour 200ml of the washing soln 1.

(1) Washing soln 1:

2X SSC made from 25X SSC) in SDS - 0.2% } 200ml H_2O.

- Pour a small volume pour off after giving a short wash. Pour 200ml of solution (solution at RT) and put the trays at 42°C - 20 min. (It will take time to 42°C by 20 minutes)

(2) Washing Step 2:

0.2% SSC & 0.2% SDS - (200 ml at 42°C)
prewarm the solution to 42°C.
incubate membranes - 20 min

(3) Washing Step 3

200ml of 0.2X SSC & 0.2% SDS - 20 min
pre heat to 50°C (preferably 52°C)
incubate membranes - 20 min

		20 λ	

↓ 14°C O/N

After putting DNA, H2O & vector ~~warmed~~ to ~50°C in water bath ~~and~~ for 30 secs. ~~and~~ and cooled at RT.
Then added ~~bf~~ lig-bf mix thoroughly and gently add ligase on ice.

Culture of host strain bacteria – Nova Blue. / ~~DE3~~ BL-21

15ml of LB + spec of strain – O/N 37°C.

11/19/99

Preparation of Competent cells and transformation of DNA to host strains

1. Culture diluted 5 times and checked O.D (BL-21) = 0.8
   Novablue = 0.8
2. Diluted the culture back down to

0·1 OD in 1·25 ml LB + 12·5 µl 1M $MgCl_2$/SO_4

ie: 170 µl ~~+ 25~~ of culture used.

↓

Grown to ~ 0·55 OD at 37°C Shaking

↓

Centrifuged remove supernatant

↓

Redissolved in 0·4 ml TFB (from MJW)
and Keep in ice - 10'

↓

Centrifuged, dissolve - 100 µl of TFB
Add 3·5 µl DMSO (from MJW)
Keep in ice 10'
Add 3·5 µl DMSO again
Keep in ice 10'

↓

Added 10 µl each of ligation mixture
& kept in ice - 30'

↓

Given a heat Shock @ 42°C for 90sec.

↓

Kept in ice 2'

↓

Added 300 µl LB + $MgCl_2$ (3 µl) SO_4 + Glucose (20mM) (ie: 8 µl from MJ)

↓

Shaken at 37°C - 1 Hr.

EXHIBIT 43

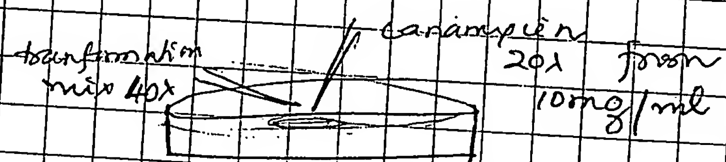
Name: Jagathpala Sheth Date: 11/19/99

Experiment:

Plating.

Plating was done on LB-agar plates.

From each tube 3 plates were plated (from for BL-21 & another each) at 40λ, 360λ & 45λ neat 10μg/ml of canamycin as the selection.



↓

Spread.

↓

37°C O/N.

11/20/99. One colony picked from plates 40λ ① & 360λ ② from each strain and a 3ml O/N culture made in LB + 1% glucose + canamycin 10μg/ml.

EXHIBIT 44

Name: Jagathpala Shetty Date: 11/22/99.

Experiment: Plasmid isolation

Isolation of Plasmid DNA

Isolation made by following the protocol for the Qiagen kit for minipreps.

(1) 3ml of culture centrifuged in 1.5ml microfuge tubes at 2 steps.

↓

(2) Add 0.3ml of bf. P1 to the pellet dislodge the pellet with P200 micropipette.

↓

(3) Add 0.3ml of bf P2 - invert 4-6 times at 4°C - sit - 5 min

↓

(4) Take P3 from 4°C and add 0.3ml to tubes and invert 4-6 times and place it on ice - 5 min and

↓

Spin 10 min

(5) Mean while set up the Qiagen column. Equilibrate the column with 1ml of QBT

↓

Take the supernatant from step 4 carefully and load to the column.

↓

(6) Wash the column with 1ml x 4 of QC. Wait till last drop drops off.

Name: Jagathpala Shetty

Experiment:

Date: 11/21/99

(7) Elute DNA in 0.8 ml of QF
wash till the last drop

↓

(8) Add 0.52 ml of isopropanol
to

(9) Spin for 30 minutes at 10,000 rpm

↓

(10) Remove sup. with fine tipped
pasteur pipette

(11) Carefully coast the pellet with
200 l of chilled 70% ethanol.

↓

(12) Air dry.

11/21/99

Resuspend the DNA in 20 l
each of sterile water.
mix at 4°C for 15-20 min

I. Introduction *continued*

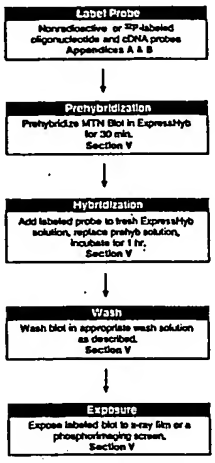

Figure 1. Overview of MTN Blot protocol. Use the β-actin probe to verify that hybridization procedures are working properly and to quantify results.

II. List of Components

Store unused MTN Blots at room temperature in a sealed plastic bag away from light.

Store used MTN Blots at 4°C in a sealed plastic bag until needed.

Store control probe at –20°C.

- 1 MTN Blot
- 100 ng Human β-actin cDNA control probe (2.0 kb) in 20 µl of TE buffer (pH 7.5). Sufficient for 2–4 labeling experiments.
- 25 ml ExpressHyb™ Hybridization Solution

III. Additional Materials Required

- 20X SSC
  - 3 M NaCl
  - 0.3 M Sodium citrate (pH 7.0)
- Wash Solution 1
  - 2X SSC
  - 0.05% SDS
- Wash Solution 2
  - 0.1X SSC
  - 0.1% SDS
- Wash Solution 3
  - 2X SSC
  - 0.1% SDS

V. Hybridization of Oligonucleotide & cDNA Probes

For hybridizing radioactively-labeled probes follow Section A. For hybridizing nonradioactively-labeled probes follow Section B.

A. Hybridization of radioactively-labeled probes

We recommend the following probe concentrations:

- cDNA probes: 2–10 ng/ml or 1–2 x 10^6 cpm/m.
- Oligonucleotide probes: 20–50 ng/ml or 1–2 x 10^7 cpm/ml.

Note: Higher probe concentrations will reduce hybridization time, but may increase background.

1. Warm ExpressHyb Solution at 68°C, and stir well to completely dissolve any precipitate. For oligonucleotide probes, equilibrate ExpressHyb at 37°C.
2. Prehybridize membranes in a minimum of 5 ml of ExpressHyb Solution, with continuous shaking for 30 min at the appropriate temperature:
   For cDNA probes: 68°C
   For oligonucleotide probes: 37°C

   Note: If you are using hybridization bottles, make sure that the marked side of the membrane is flush against the side of the bottle. Bubbles between the membrane and the bottle can give the appearance of bubbles on the blot.
3. Denature radioactively labeled probes at 95–100°C for 2–5 min. Then chill quickly on ice.
4. Add radiolabeled probe to 5 ml of fresh ExpressHyb, and mix thoroughly.
5. Replace the ExpressHyb Solution with the fresh solution containing the radiolabeled probe. Remove all air bubbles from the container, and make sure ExpressHyb Solution is evenly distributed over the blot.
6. Incubate with continuous shaking for 1 hr at the appropriate temperature:
   For cDNA probes: 68°C
   For oligonucleotide probes: 37°C
7. Rinse the blot in Wash Solution 1 several times at room temperature. Wash for 30–40 min with continuous agitation; replace the wash solution several times.
8. Wash the blot two times in Wash Solution 2 with continuous shaking for 40 min at the appropriate temperature:
   For cDNA probes: 50°C
   For oligonucleotide probes: room temperature
9. Remove the blot with forceps and shake off excess wash solution.

   Note: Do not allow the membrane to even partially dry. Allowing the membrane to dry can cause high background and will make subsequent probe removal difficult.

V. Hybridization Protocols *continued*

10. Immediately cover the blot with plastic wrap. Mount on Whatman 3 MM Chromatography paper. Wrap again with plastic wrap.
11. Expose the MTN Blot using a phosphorimaging screen. The Storm® PhosphorImager (Molecular Dynamics) is suitable for this application. Alternatively, expose to x-ray film at –70°C with two intensifying screens.
12. Strip probe from the blot by incubating the blot in sterile H_2O containing 0.5% SDS as outlined below.
    a. Heat the sterile H_2O/0.5% SDS solution to 90–100°C.
    b. Remove plastic wrap from blot and immediately place in the heated solution. Make sure that exposure to air is minimal.
    c. Incubate for 10 min, shaking frequently.
    d. Allow the H_2O to cool for 10 min before removing the blot.
    e. Remove the blot and air-dry until it is dry enough to be slipped into a plastic bag. The membrane can be stored at –20°C until needed.

EXHIBIT 65

Name: Jagathpal Shetti Date: 10/16/99
Experiment: Northern Blot analysis

Probe were purified in 0.5 ml of eluting buffer, denatured at 95°C & chill on ice.

~~Added to 7 ml of the~~

After time the membrane (from

(1) A Mandal, - MTN - Blot from Clontech - used once, stripped dried) was incubated with 7 ml of pre hyb soln at 68°C in a plastic bag (sealed) for 1 1/2 hrs. (carefully shake [illegible])

(2) Purified probe added to 7 ml of exp. hyb. ~~and~~. The plastic bag was emptied and the ~~solution was~~ bag filled with the solution. Sealed carefully and incubated at 68°C. 1 1/2 hrs.

(3) Discard the exp hyb soln ~~and~~ ~~wash~~ place it on a dish and wash several times with wash bf 1. (2x SSC, 0.05% SDS) and incubate with the same for 40 min. Replace the wash soln 3 times (temp. RT)

(4) Replace with wash soln 2. (0.1x SSC, 0.1% SDS, 50°C) 40 min - 3 changes.

(5) Take the Blot in little amount of

Name: Jagathpal . Shetti Date: 12/16, 19

Experiment: Western Blot analysis of C58

wash buffer. Place it on a platform made out of a whatman paper and a saran wrap.

Place another saran wrap on the top of the ~~gel~~ blot immediately (so as not allow it to be dried). Place the marker spots on the edges.

Place the blot inside the cassette. with intensifying screen. expose for 18 hrs.
